

# **CYCLEMATIC**

## **SERVICE MANUAL**

**MODEL : CTL-618EM**

MANUFACTURER:

**CYCLEMATIC**

**MACHINERY CO., LTD.**

20, LANE 50, MIN SHENG RD.,  
SHEN KANG, TAICHUNG,

TAIWAN, R.O.C.

TEL: 04-5625393 • 5626509

FAX: 886-4-5620298

MACHINE

NO.

## **PURPOSE OF THIS MANUAL**

The model CTL-618 series machine is built for easy and safe operation and excellent manufacturing of work in process. The machine is built with high quality material, and carefully to exacting standards that guarantee the life, economical use, accuracy, and minimum maintenance of the machine.

This manual is an introduction to the CYCLEMATIC model CTL-618EM HIGH ACCURACY TOOL ROOM LATHE. It is used for installation, operation and servicing of the CTL-618EM CYCLEMATIC MACHINES.

Also, for fast reference, because it is necessary to make minor adjustments or do preventive maintenance.

( For personnel and operators who deal with the CTL-618EM machine. )

**Place Two Levels ON Slide Way**

**CTL-618EM**

**Adjusting process for leveling machine**

- 1.Put pads C (Fig.B) under each of six points.
- 2.Loose set screw A (Fig.B).
- 3.Insert a pin wrench into the hole B.  
raise or lower by turning (C.W.or C.C.W)
- 4.Tighten set screw A (Fig.B) to lock.
- 5.Be sure every point is touching the ground to support the machine.

## THREAD CUTTING

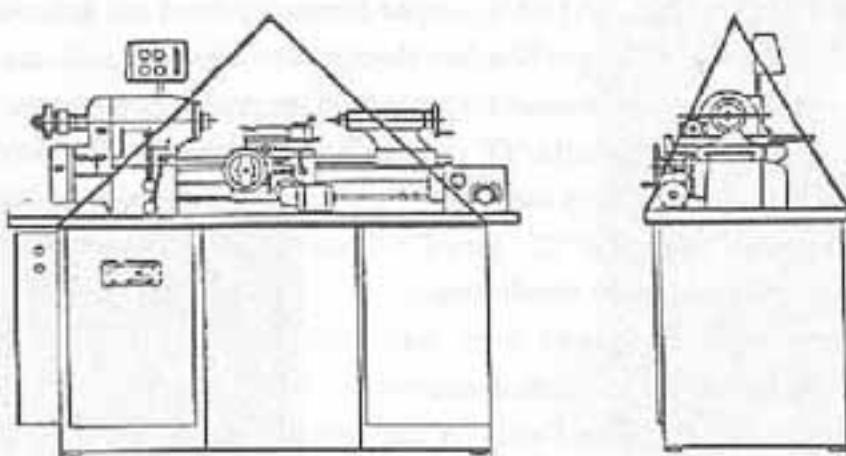

Figure 1 - Lifting machine

Lifting machine, arrange rope or cable as shown in figure 1, and check to see if the correct balance has been obtained. Then insert pads of soft cloth between the edges of the rope and machine. The net weight of this machine is approx 830 kgs (1830 lbs). So the rope or cable must be rated at 3000 lbs capacity.

### A.) INSPECTION AND CLEANING OF MACHINE

An inspection should be made after arrival of the machine in your plant. Look for possible damage caused by shock or vibration during transportation, also check for any missing parts, standard tools or other equipment.

In shipment, all exposed surfaces of the machine are coated with a antirust liquid. Before moving carriage and cross-slide, leadscrew tailstock...etc, these surfaces should be thoroughly cleaned to remove all antirust liquid use a soft brush and solvent. This is very important because it can prevent any dirt or grit which may have accumulated on the antirust liquid from working under the sliding members and causing undue wear.

\* CAUTION : DO NOT USE COMPRESSED AIR TO CLEAN, WHICH WILL REDUCE THE MACHINE'S LIFE.

### B.) FOUNDATION, INSTALLATION, AND LEVELING

A fairly flat foundation and proper installation will provide the machine long-term high accuracy, so supplying a good solid foundation of proper thickness is important. (Generally, a thickness of 300mm (12") is considered to be enough.) The machine has six adjustable feet on the corners of the pedestal base, used for leveling the machine. Place the pads under the feet of pedestal. To adjust, loosen the set screw and raise or lower the foot with a pin wrench so that all six feet rest firmly on the floor. When the adjustment is done, tighten set screws.

### C.) ELECTRICAL CONNECTIONS

The CTL-618EM TOOL ROOM LATHE is shipped completely wired and assembled. Turn Cam Switch "A" (Figure 2) to the "OFF" position, then check motor voltage. Loosen screws "B" (Figure 2), and open the switch case cover, connect the wires from the power source to the terminals (R.S.T), and ground connection is made at the "G" (Figure 3) which is the electric switch case.

Place Control Lever "G" (Figure 4) in the "LOW" position, pull out Spindle Locking Pin "E", turn "C" (Figure 5) in forward position. The spindle should rotate counterclockwise when viewed from the tailstock end of the machine. If the spindle does not turn in the correct direction, turn Cam Switch "A" to "OFF" position. Disconnect electric power source, and interchanges any two leads until the turning direction is correct. When the spindle is rotating correctly, secure switch case cover, turn Cam Switch "A" to "ON" position.

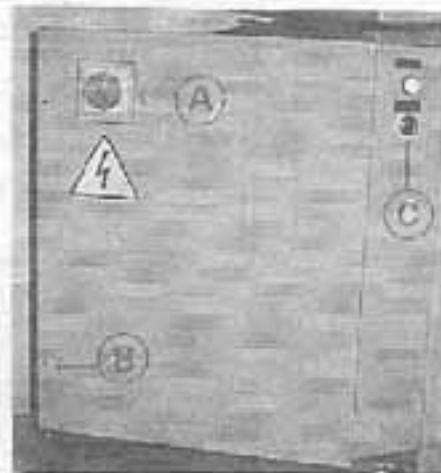

Figure 2 - Control Unit Door

\* CAUTION : RUNNING THE MACHINE IN THE WRONG DIRECTION WILL RESULT IN DAMAGE TO THE SPINDLE SPEED CHANGE UNIT.

### D.) LUBRICATION

Proper lubrication supplied carefully, will maintain the life and performance of the machine for a long period. Therefore, lubricate the machine with a high quality lubricant, and check periodically to assure that the lubricant in the oil sight gage is filled to the proper level.

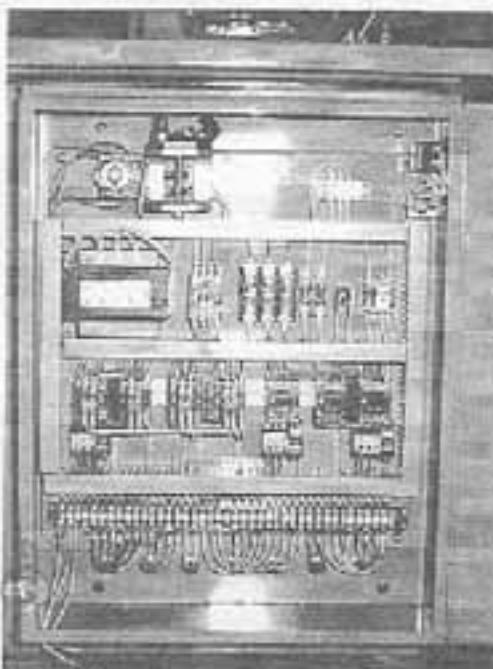

Figure 3 - Control Unit

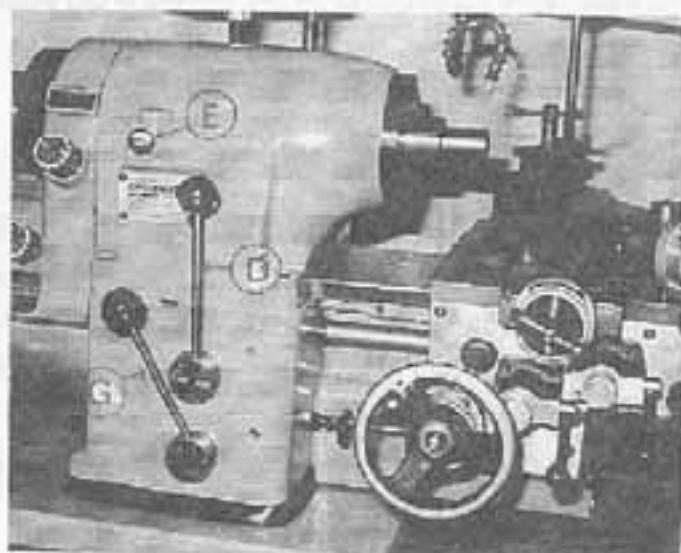

Figure 4 - Control Speed and Direction

## 1. VERTICAL SCREW

Lubricate the vertical screw "V" (Figure 6) with grease in fitting "N" as shown in (Figure 6). There after grease monthly or as necessary. Whenever you start to operate the machine, add a few drops of light oil in the Vertical Screw "V" (Figure 6) and the Brake Cork "C" (Figure 14).

## 2. CARRIAGE LUBRICATION

Fill with Mobil Vactra Oil No.2 or equivalent in oil reservoir. Maintain oil level in Sight window "W" (Figure 7). To lubricate carriage and bed ways, lift plunger on reservoir "R" (Figure 7) hold briefly and release to keep bed ways lubricated.

## 3. GEAR BOX AND CLUTCH LUBRICATION

Maintain oil level in sight windows "W" (Figure 8). To fill gearbox, remove plug "C" (Figure 8) use Automatic Transmission Fluid Mobil 200 (Esso ATF or equivalent). Change oil every 500 HRS.)

To drain oil, remove the Drain Plug "M" located under the oil gearbox (Figure 8)

**\* CAUTION : USE OF ANY OTHER TYPE OF OIL IN THE GEARBOX MAY RESULT IN DAMAGE TO THE CLUTCH SURFACES.**

## 4. HEADSTOCK LUBRICATION

The headstock spindle is mounted on precision preloaded ball bearings. The ball bearings are grease packed for life and require no further lubrication.

## E.) SPINDLE CONTROL LEVERS

To change spindle speeds. Push start button (M) Figure(5). Turn cam switch (C) to the forward or reverse position and move lever (G) Figure (4) to the low position. Turn cam switch (I) Figure (5) to the left to increase speed and to the right to decrease speed. Moreover hold the cam switch to left or right until required speed is indicated in the sight window.

Figure 5 - Speed Control box

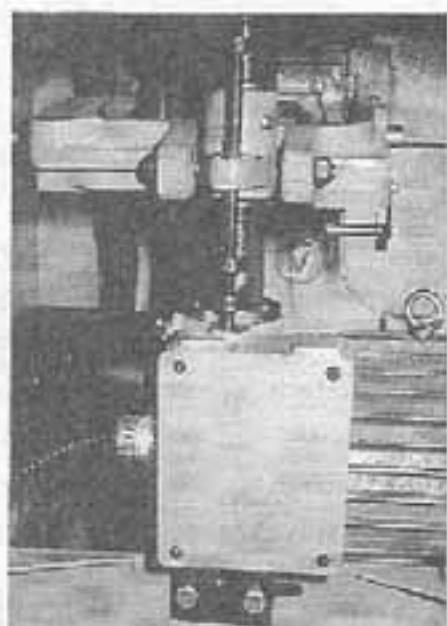

Figure 6 - Speed Change Unit

Figure 7 - Carriage Lubrication

Speeds in the right side of sight window are obtained with lever (G) Figure (4) in the high position and speeds in the left side of sight window are obtained with lever (G) in the low position. The spindle speeds can be selected to suit each particular job that depends on type of material work diameters and tooling being used.

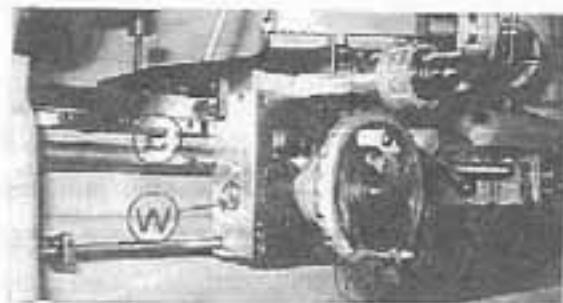

Figure 8 - Gear box Lubrication

#### F.) FREE SPINDLE

To obtain a free spindle for turning the spindle by hand move lever (G) Figure(4) to the stop position. Turn cam switch (C) Figure(5) to brake off position and push start button (M). The spindle will rotate by hand easier after machine has been run at a speed of 1100 RPM or over.

#### G.) QUICK CHANGE GEAR BOX

The Quick Change Gear Box Unit see (Figure 9& 11), feed or thread change knob "T", shifted to left is threading shifted to right is feed only. The range of threads, their selection and the position of the knobs for each thread are shown on the chart "C" (Figure 10). Pull out the ball of gear change arm "A" (Figure 10). Then move arm to left or right, insert in correct position, and change the speed change knob "S" to 1, 2, or 3 position until desired thread cutting is acquired see (Figure 10). The standard threads and pipe threads are immediately available through the gear box by the use of outside change gears(five change gear assembly). pitches of threads can be cut to 250 threads per inch.

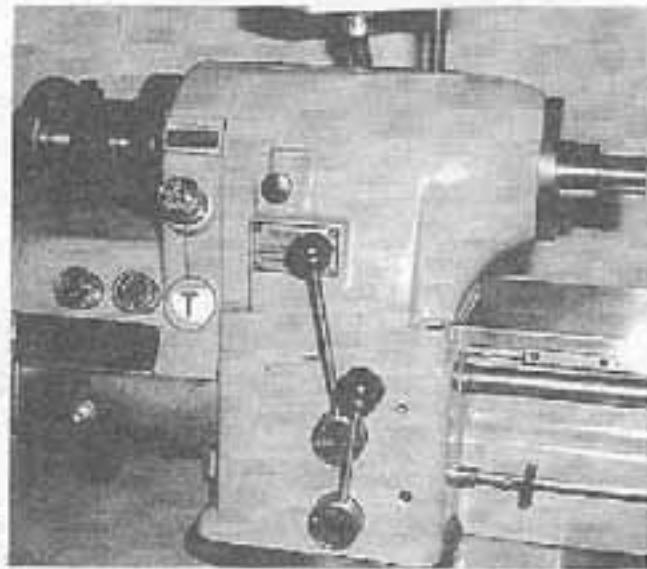

Figure 9 - Feed of Thread Change

\* CAUTION : DO NOT SHIFT GEARS KNOB "T" WHEN THE SPINDLE IS RUNNING

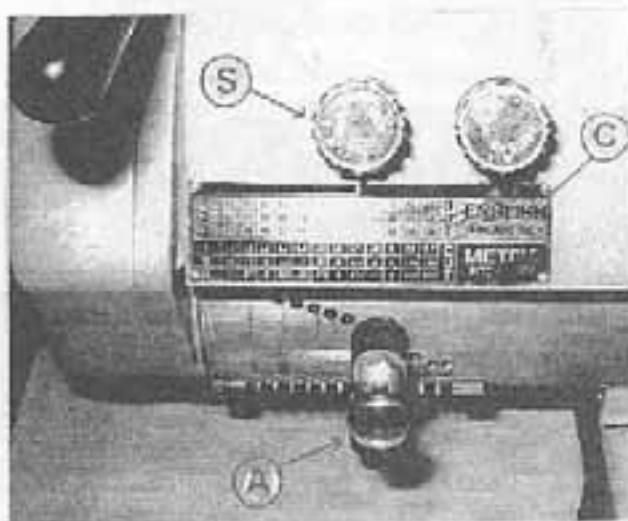

Figure 10 - Thread Chart

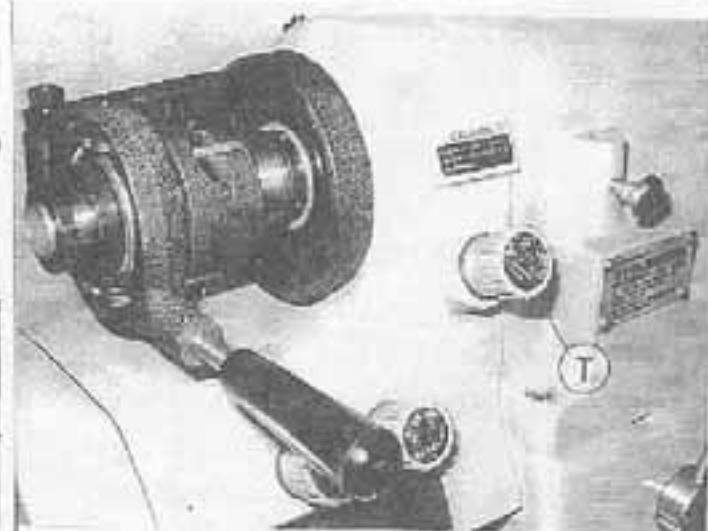

Figure 11 - Feed or Thread Change

## H.) AUTOMATIC THREAD LENGTH CONTROL

When threading into a blind hole or to a shoulder without a thread relief. The lead screw half nut is engaged at the start of the threading and remains engaged until threading work is completed. Left or right hand threads are controlled by Control lever "D" (Figure 4), the lever is joined with the control bar "B" (Figure 12). When the carriage touches the adjusting screw "S" (Figure 12) of the length control bar, it will push the lever "D" to "STOP" position, and make the lead screw stop. For method of threading cut, please see Page 8, QUICK ACTING.

## I.) SPINDLE BRAKE

The Spindle Brake is built for rapid stopping of the headstock spindle. Turn the Control Lever "G" (Figure 4) to "BRAKE" position, the spindle will automatically brake at all speeds within a few seconds. The Brake is actuated when the brake cork "C" (Figure 14) is forced against the brake drum (Figure 14) by spring action and is released by a solenoid. Allowing brake cork to become dry will reduce belt and brake life, so add a few drops of spindle oil to the brake drum as often as necessary.

## J.) BRAKE ADJUSTMENT

To adjust the brake, start the machine. Run it at 1500 RPM. While the machine is running, insert a 5mm allen wrench in the screw head located under the electrical connector on the brake solenoid (Fig. 3). Turn the screw counterclockwise until brake cork contacts drum, then turn clockwise until noise disappears. At 1500 RPM the brake should stop the spindle in approx .3 sec.

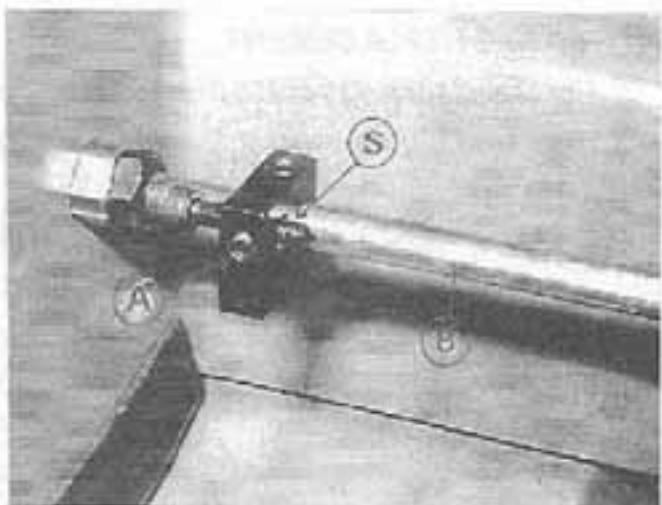

Figure 12 - Thread Length Control

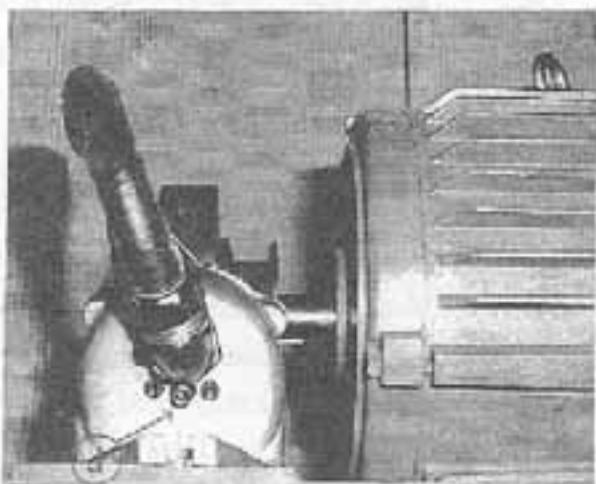

Figure 13 - Brake Adjustment

Figure 14 - Brake Cork Replacement

## K.) BRAKE REPLACEMENT

1. Disconnect wires #25 & #25 from terminal strip and remove conduit.(Fig.3)
2. Remove tow bolts K (Fig.14) with 14mm wrench.
3. Loosen set screw "M" (Fig.14) in keyway, turn adjusting screw "J" (Fig.13) counterclockwise and remove brake housing. Use a pin punch through adjustment hole to remove brake cork.
4. Install new brake cork and assemble in reverse order.

## L.) BELT ADJUSTMENT

Run spindle at approximately 1000 RPM. Move lever "G" (Figure 4) to center "STOP" position and let the spindle coast to a stop. This is done to equalize belt tension. Move lever "G" (Figure 4) to the high or low position. Losen lock nut "N" (Figure 15) 19mm wrench. Turn adjusting screw "D" (Figure 15) 6mm socket head wrench clockwise to tighten belts. Stop machine and check belt tension, there should be approx. 1" of play in belt.

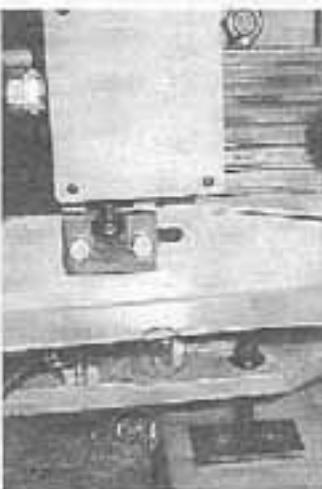

Figure 15 - Belt Adjustment

## M.) COLLET CLOSER REMOVAL

Running the machine with the collet closer and not having a collet locked in place will damage the collet closer. Remove the collet closer when using chucks, face plates, or spindle nose type fixtures. The collet closer should be removed often for cleaning to prevent loading of chips between collet closer tube and inside of spindle at rear and collet threads. Removal method is . Pull out pin "L" (Figure 17). Slide draw tube out of the spindle. Do not turn the adjusting nut "N" (Figure 17). It is keyed to the spindle. To remove slide it off the end of the spindle. Do not remove collet closer by removing screw "S" (Figure 17), this screw has been adjusted at the factory for proper operation of the collet closer .

Figure 16 - Collet Closer Adjustment

## N.) COLLET CLOSER REPLACEMENT

Before replacement of the closer, clean inside of the headstock spindle and outside diameter at rear of spindle where Adjusting Nut "N" (Figure 17) is located. Apply a film of light oil on rear of spindle. Do not force Adjusting Nut "N" on spindle. If Adjusting Nut "N" fits too tight, remove and check for burrs or scratches, then replace. Clean collet closer tube inside and out apply a film of light oil on slip surface "T" (Figure 17) of the collet closer tube, replace collet closer and insert Link Pin "L" (Figure 17).

## O.) COLLET CLOSER ADJUSTMENT

1. Before using collet closer, and any collet or step chuck to be used should be thoroughly cleaned 2. Push the lock Pin "E" (Figure 4) . To engage lock pin, turn spindle by hand till lock pin enters notch to lock. 3. Press the Closer Adjusting Finger "F" (Figure 16) down to the point "P" (Figure 16). 4. Place collet closer tube on collet or step chuck until engaged. Turn both collet closer tube and shell Guard "G" (Figure 15) forward with the left hand, and hold the collet or step chuck with the right hand at the same time. 5. Place a work piece in collet or step chuck. 6. Place lever "L" (Figure 16) to the extreme left fixed position. Turn the Shell Guard "G" (fig.16) toward operator until the work piece is clamped by the collet. 7. Place lever "L" to the right, the released position. Turn Shell Guard "G" toward operator, move the Adjusting Finger "F" advance two notches on the adjusting nut "N" (Figure 17) and close Adjusting Finger "F". 8. Test collet closer's tension on work piece. If the work piece needs additional gripping pressure, press down on the adjusting finger "F" and turn Shell Guard "G" forward and lock. (see figure 16)

## P.) CARRIAGE INDICATING RING

Dual dials with English and Metric Handwheel dial "W" (Fig.18) graduations are in 0.01" 0.2mm. It is built for the operator's convenience of operation. (Fig.16) Spring loaded indicating ring, just turn to required location by loosening lock screw "L" (Fig. 18) Sliding cover cage exposes only the dial in use.

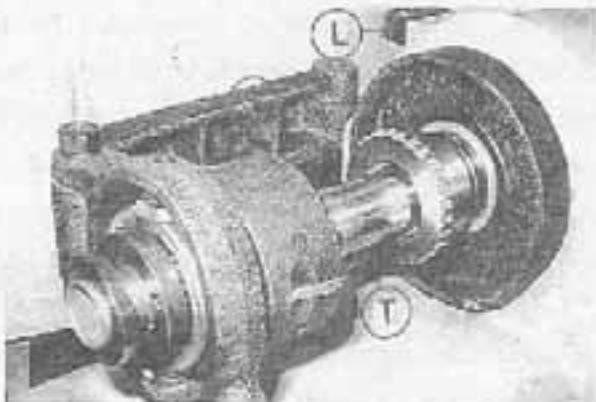

Figure 17 - Collet Closer Removal

## Q.) CARRIAGE LOCK

To hold the carriage in a fixed position on the bed use the Carriage Lock Handle "H" (Figure 19). Move the lock handle "H" clockwise toward the operator, lock the carriage in position. Move the lock handle "H" counterclockwise away from the operator. To unlock the carriage.

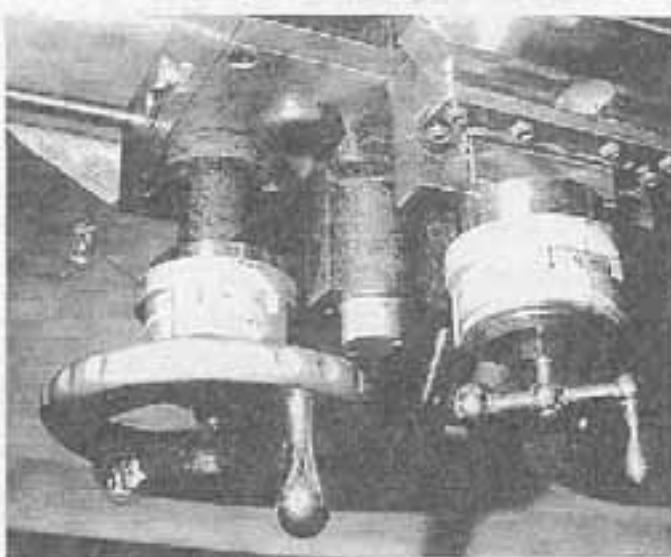

Figure 18 - Carriage Indicating

## R.) CARRIAGE CLUTCHES

The carriage clutches are made of a friction type material, designed to slip when slide or carriage engages a feed stop. The clutches are a spring-loaded arrangement and can not be adjusted for more pulling power. If clutch slips under a cut, it is a sign of improper tool grinding, dull tool or excessive feed. The friction clutches have sufficient power to handle all work.

When the machine contacts a feed "stop", it is intended for the clutch to slip. To operate clutches as shown in (figure 20), raise handle "H" (figure 20) is approx. 20 degrees above horizontal, the clutch will engage. Push down the handle "H", the clutch will release. When the carriage lead screw is engaged for threading the carriage feed clutch is mechanically interlocked (can not be engaged). This is to prevent machine damage. Adjust clutches as shown in Figure 20.

Figure 19 - Carriage Lock

### S.) CROSS SLIDE INDICATING RING

Dualdials with english and metric handwheel dial. Each graduation of the Indicating Ring "C" (figure 21) is 0.001" (0.02mm) on the diameter. It is provided for operator's convenience. The Indicating Ring is spring loaded, so a lock screw is not needed. To use it, just turn the Indicating Ring to required location by hand. Cross Slide operation of feed and adjustment of clutches are identical with the operation and adjustment of carriage clutches. If CTL-618EM TOOL FOOM LATHE needs to be used with the taper turning attachment, loosen the screw "S" (figure 19) with a spanner wrench.

### T.) QUICK-ACTING TOOL POST COMPOUND SLIDE ASSEMBLY

The compound slide has a quick-acting tool post, at the start of threading cut, place the ball-handle "H" (Figure 21) of the quick-acting tool post toward the workpiece, at the end of the threading cut, the threading tool is instantly cleared from the work by hand operated, handle "H", for the return of the carriage to the next cut, the ball-handle lever actuating the tool post slide feed screw. Operate above procedure repeatedly until the threaded work piece is completed. Each graduation of the indicated ring "C" (Figure 21) is 0.001" (0.02mm) on diameter.

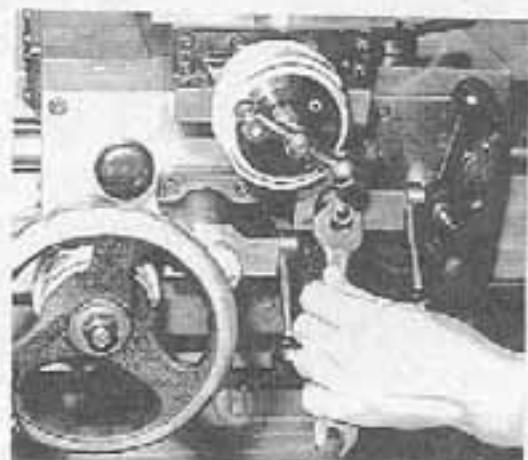

Figure 20 - Carriage Clutches

Figure 21 - Cross Slide Indicated Ring and Quick Acting

**\* CAUTION : THE BALL-HANDLE LEVER OF THE QUICK-ACTING TOOL POST MUST BE MOVED TOWARD OPERATOR AT THE END OF THE THREADING CUT.**

## **U.) POWER FEED UNIT**

The carriage Power Feed unit is mounted on the carriage.

It is powered by a direct current motor (Figure 22).

1. The power feed can be operated only when the machine is running.  
Start the power feed by turning Cam Switch 'S' (figure 23).
2. The Cam Switch "S" (figure 23) controls the direction of the power feed.
3. The carriage Feed Control "N" (figure 23) controls the rate of feed. When Cam Switch "S" is placed in "RIGHT" position, the carriage will feed toward the right, the cross slide will feed away from the operator.
4. When Cam Switch "S" is placed in "LEFT" position, the carriage will feed toward left, the cross slide will feed toward operator.
5. Turn Cam Switch "S" to "STOP" position, power feed motor is then off.
6. The rate of the carriage feed should be pre-selected to suit each particular job, which depend on material, diameter, type of cut, and tooling used.
7. The numbers on the carriage feed control panel, do not represent either thousandths per revolution or inches per minute. So the operator must test sample pieces for determining the spindle speed and rate of feed which can best suit to the requested surface finish and production rate, then record the proper settings after testing.

**NOTE : WHEN STARTING INTO PRODUCTION. AN OPERATOR CAN SET THE FEED CONTROL "N" TO THE RECORDED REFERENCE SETTING, THEN THE SAME TESTED RESULTS WILL BE OBTAINED.**

## **V.) COOLANT FACILITIES**

The coolant pump is controlled by Switch "C" (figure 2). Turn Switch "C" to "ON" position, the pump will run continuously, turn to "AUTO" position, the pump will run only when the machine is running. If pump switch is set at "OFF" position, the coolant pump is off. Sump should be cleaned periodically, depending on the type of material being machined.

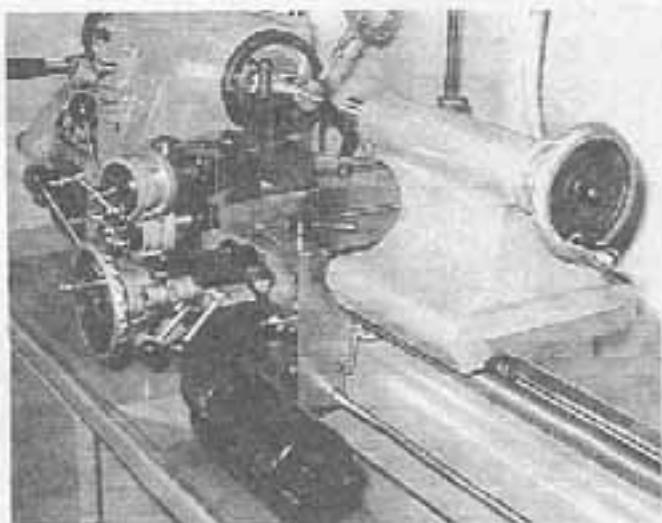

Figure 22 - D.C Motor

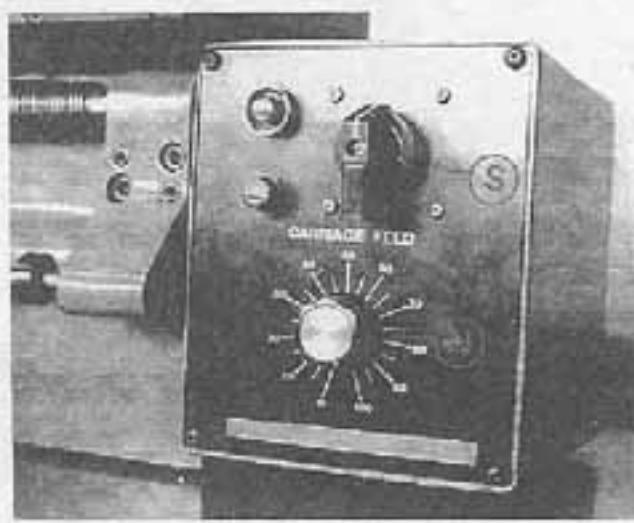

Figure 23 - Power Feed Unit

## W.) TAILSTOCK

The tailstock is mounted on preloaded ball bearings and can support any load to the spindle. It is provided with a fine "feed" for accurate work. The spindle of the tailstock is graduated in eighths of an inch, and 1mm and has a travel of 3 3/4" (92.25mm). The handwheel is dual dial English and Metric. Graduations are 0.001" (0.02mm). It is built for the operator's convenience of operation just turn the dial ring "D" (Figure 25) to the required location. It is unnecessary to tighten the dial rings. They are spring loaded, so a lock screw is not needed. Sliding cover cage exposes only the dial in use.

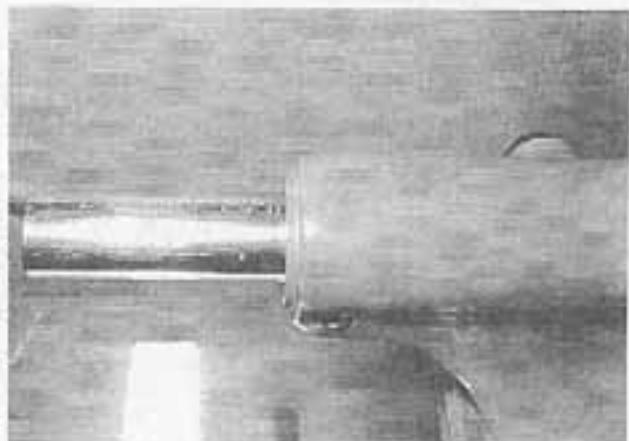

Figure 24 - Tailstock Spindle Travel

## X.) TAILSTOCK SPINDLE LOCK

The tailstock spindle lock holds the spindle securely in any travel position. Move lever "L" (Figure 25) toward the headstock lock position and backward to the released position.

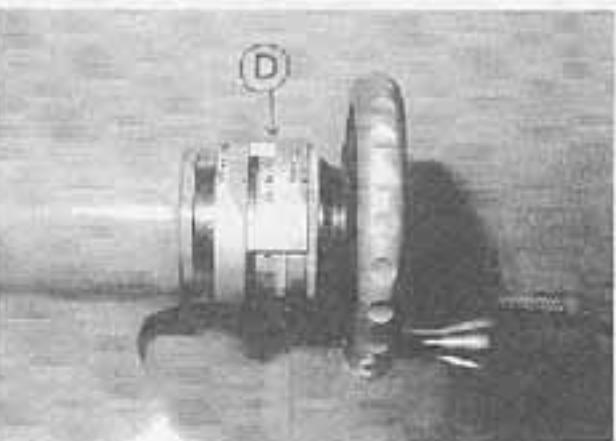

Figure 25 - Handwheel Dial Ring

## Y.) TAILSTOCK BODY LOCK

The tailstock can be clamped in any position along the bed way by operating Lever "M" (Figure 26). The Lever "M" should be adjusted to a clamp position between the two stop pins "A" and "B". When tailstock is fully clamped, lever "M" should not contact stop pin "A".

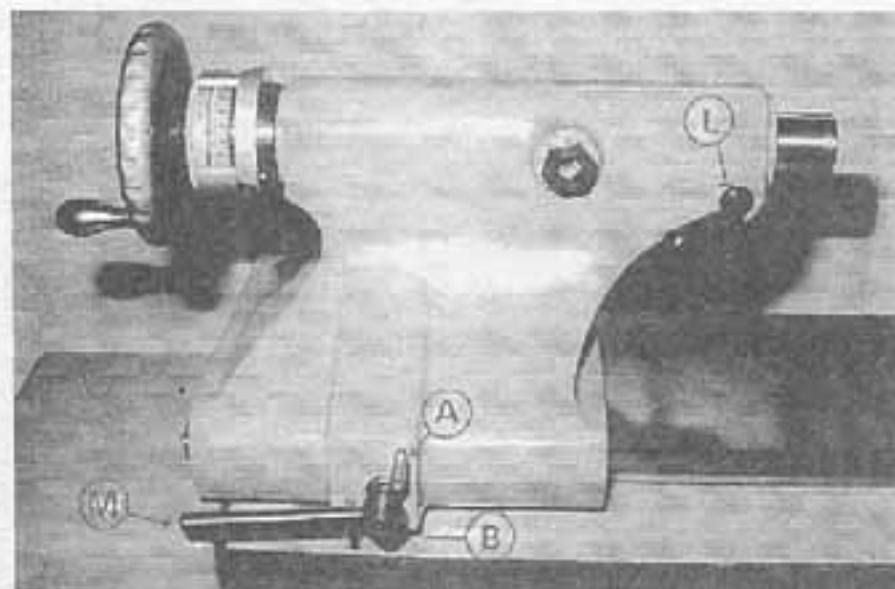

Figure 26 - Tailstock Spindle and Body Lock

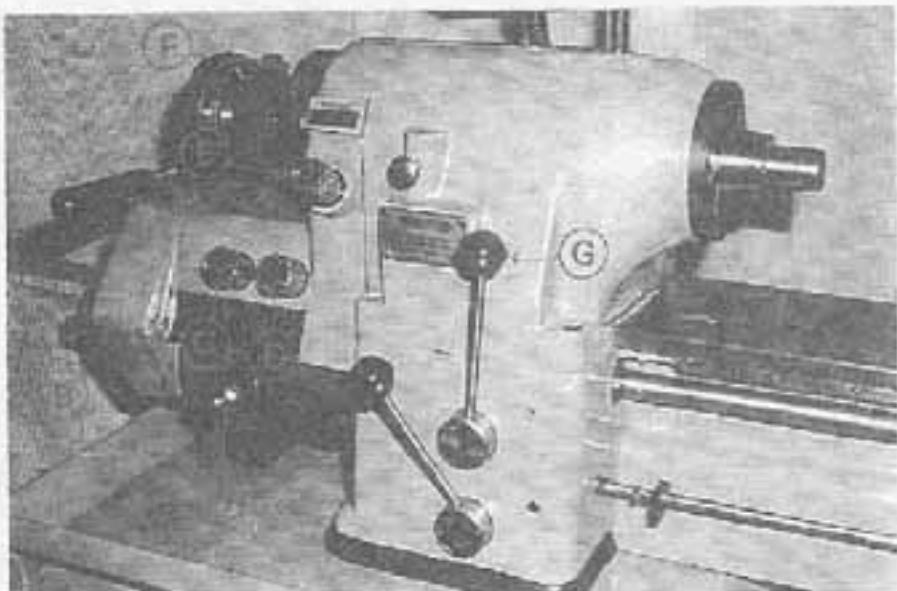

Figure 1 - Headstock and Gearbox

## THREAD CUTTING

### **CAUTION : Do not run spindle in reverse when threading.**

The CYCLEMATIC CTL-51SEM is designed for rapid and accurate thread cutting. The quick-change gearbox permits instant selection of 36 different English and metric threads. Threads can be cut to a shoulder without running into the shoulder since the automatic stop will limit carriage travel at a predetermined point in either direction. Before starting to cut a thread, select the proper cutting speed for the size of thread to be cut and to give the best finish for the particular material being used. Maximum recommended threading speed is 1000 RPM.

Set the quick-change gearbox for desired pitch. To make a selection on the gearbox thread chart, pull the spring-pressured knob "A", Figure 1, out as far as it will go and lower it until it will move sideways to the desired notch directly under the thread required. Raise the handle and let plunger drop into hole. If tumbler handle will not raise far enough to position plunger into hole, loosen knob "S", open gear box door and rotate gear "T", Figure 4, until gears mesh and handle raises, permitting plunger to seat.

### **DO NOT SHIFT GEARS OR OPEN GEARBOX DOOR WHILE MACHINE IS RUNNING.**

Set three-change knob "C", Figure 1, for number corresponding to left side of gearbox thread chart. Set knob "C" so desired number is in bottom position in line with arrow. If the sliding gear cluster does not engage the other gears in gearbox properly to bring the desired number on three-change knob "C" in line with arrow, loosen knob "B" open gearbox door and rotate gear "T", Figure 4, until gear mesh.

Set English /Metric knob "D", Figure 1, so thread system to be cut reads at top of knob. If the sliding gear does not engage properly to bring desired system to read at top, loosen knob "B", open gearbox door and rotate gear "T", Figure 4, until gears mesh and knob is felt to engage detent.

Engage gearbox by turning knob "E", Figure 1, counterclockwise in the direction of arrow marked "THREAD". When turning knob "E", the teeth of the sliding gear within the gearbox may not mesh with the headstock spindle gear teeth. If this is the case, turn headstock spindle with handwheel "F" while turning knob "E" to left until definite click is heard.

Set compound slide at  $61^{\circ}$  and position cutting tool in compound slide tool post. Position carriage with handwheel so threading tool is in the center of the part to be threaded.

Carriage control lever "G", Figure 1, when moved to the left, will cause carriage to move to the left. When the carriage control lever is moved to the right, the carriage will move to the right. Carriage travel can be stopped at any time by placing control lever "G" in center position.

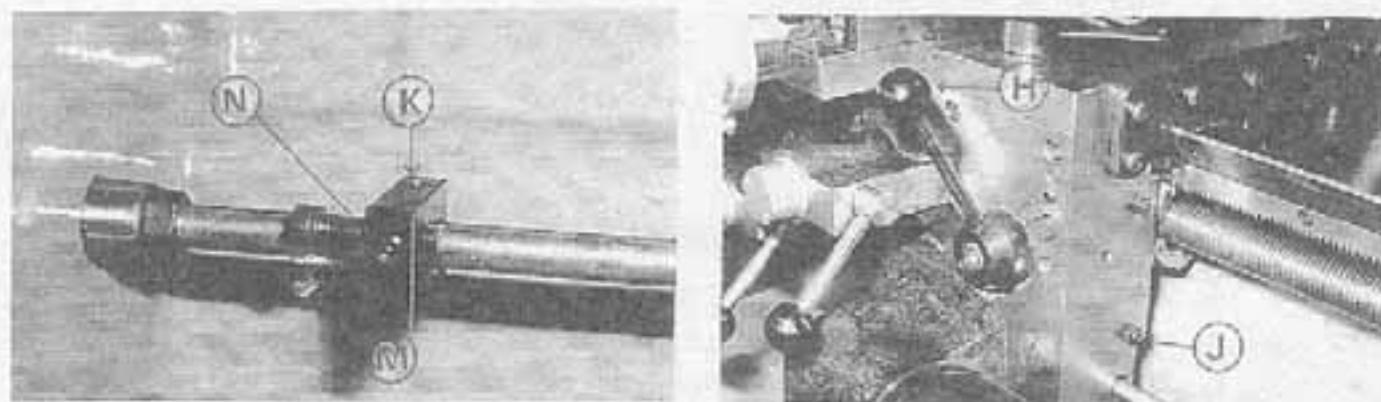

Figure 2 - Thread Length Control

**NOTE : Carriage power feed unit is not used threading operation.**

Place lever "G" in center position and engage lead screw nut "F", Figure 2, by moving ball handled lever "H" clockwise. Set two carriage stops "M" approximately  $1/2"$  from both ends of carriage. Loosen screw "K" to make area location of stops. Loosen lock screw "N" and turn stop screw "L" to make fine adjustment. With threading tool away from work toward operator, make a trial run with carriage. Pick up the exact relation between the tool and the shoulder or end of the thread by using tool post slide. Run carriage to right, checking stop. Make adjustments so tool will clear end of work by  $1/4"$ .

**CAUTION : Lock carriage stops securely before starting to cut the threads. Do not release carriage nut "J" until threading operation is completed.**

With carriage at rest and quick-acting handle "P" Figure 3, forward in cutting position, feed the desired amount for each threading pass using cross slide handwheel "R".

Move lever "G", Figure 1, to the left and carriage will travel until it contacts stop at headstock end of machine. The headstock spindle will continue to run. Carriage stops cause only the gearbox, lead screw and carriage to stop.

After each pass, withdraw threading tool from work with quick-acting handle "P", Figure 3, and return carriage to starting position by moving carriage control lever "G", Figure 1, to the right.

**LEFT- HAND THREADS** can be cut the same as right - hand with the spindle running "FORWA-RD" except that cutting pass is made from the headstock toward the tailstock. Carriage control stops are used for left-hand threads as well as right - hand threads.

#### **OUTSIDE CHANGE GEARS**

The outside change gears are used to cut threads not provided in the quick-change gearbox. A set of five gears and a bracket are supplied as standard equipment with each machine. These gears, when set up to the gear chart, Page 8 will cut 10 threads per inch or 0.25 mm pitch according to set up. Three of the gears are shipped on the bracket and the other two are in place on the shafts as shown at "U" and "W", Figure 5.

#### **BEFORE SETTING UP CHANGE GEARS, PLACE KNOB "A", FIGURE 1, IN THE "OUT" POSITION**

Fastened to the tumbler handle bracket within the gear box is a round safety bar "X", Figure 5, that extends out through a slot in the gearbox plate. This bar is to prevent applying change gears outside the gearbox until the tumbler handle is placed in the "OUT" position.

Additional gears are available to cut other threads which are not available through gearbox.

Lubricate bushings and shafts on change gear bracket with spindle oil each time a setup is made. If long run threading is involved, lubricate daily.

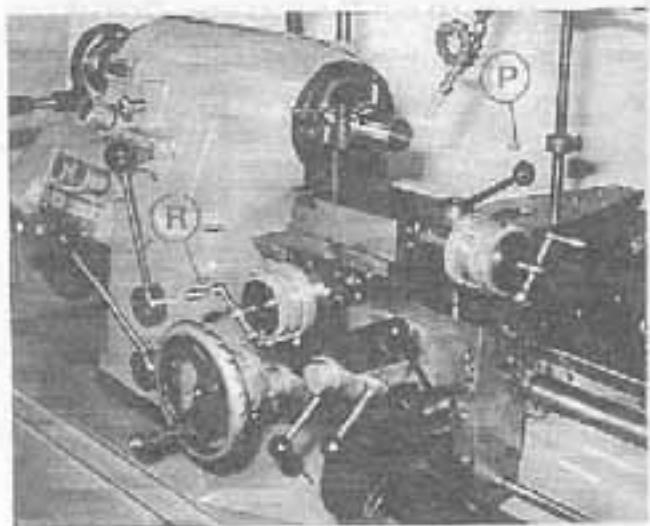

Figure 3 - Carriage and Compound Slide

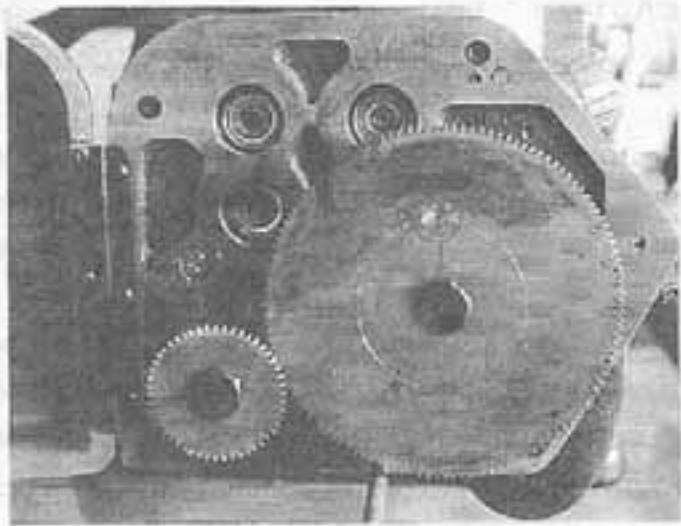

Figure 4 - Threading Gearbox

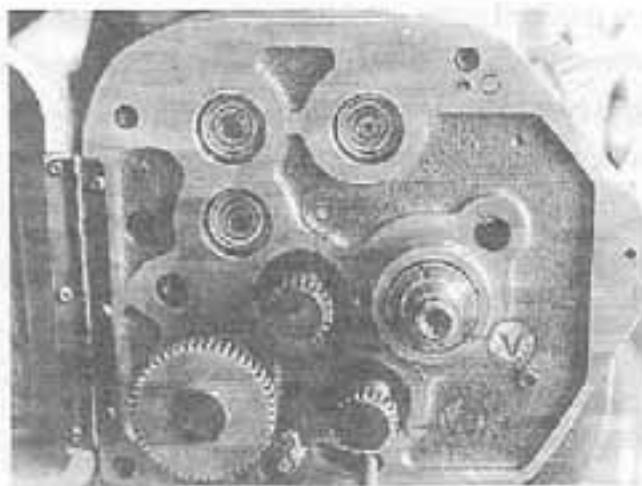

Figure 5 - Threading Gearbox

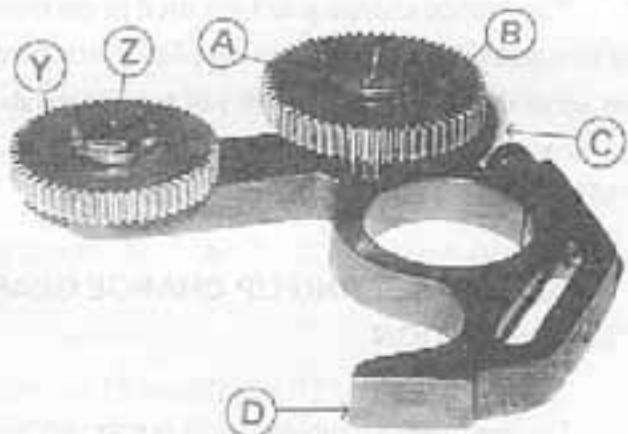

Figure 6 - Change gear Bracket

### English Threads Using Outside Change Gear

1. Turn disconnect switch "OFF".
- 2 On English side of change gear bracket "D", Figure 6, mount "First Gear on stud" "C" with spacer between gears. Do not tighten bolt "A" fully.
3. Mount "Idler Gear" "Y" but do not mesh with "First Gear on Stud" "C", or tighten bolt "Z" fully.
4. Losen knob "S", Figure 1, open gearbox door and remove 50 tooth gear "S", Figure 4, and 127 tooth gear "T". Do not misplace key under 50 tooth gear.

5. If thread chart specifies number of teeth in "First Gear" to be other than 22 teeth, remove gear "U" Figure 5, and replace with specified gear.
6. Remove tumbler gear "W".
7. Mount Change gear bracket assembly, Figure 6, on pivot post "V", Figure 5. Do not tighten bracket bolt "H", Figure 7, fully.
8. Make certain key is in place and mount "Screw Gear" "J", Figure 7. Replace bolts "K" and "M".
9. Adjust "Second Gear on Stud" "G", Figure 7, with 0.003-0.004 backlash between it and "Screw Gear" "J". Use plastic shim stock to help determine backlash. Tighten bolt "F".
10. Adjust "Idler Gear" "E" with 0.003-0.004 backlash between it and "First Gear on Stud" (behind "Second Gear on Stud" in picture). Tighten bolt "N".
11. Pivot bracket to obtain 0.003-0.004 backlash between "First Gear" "L" and "Idler Gear" "E". Tighten bracket bolt "H".
12. Make certain all gears are properly meshed and all bolts tightened.
13. Close gearbox door, tighten knob "B", Figure 1, and turn three-change knob "C" to position specified on chart.
14. Turn English/Metric knob "D" to "English".
15. Turn Feed /Thread knob "E" to "Thread".
16. Follow same procedures for setting carriage stops lead screw nut and compound slide as when cutting threads from the gearbox. Use of carriage control lever "G", Figure 1, and quick-acting handle "P", Figure 3, will also be the same as when cutting threads from the gearbox.

**NOTE :** (a) 50 tooth gear "S", Figure 4, and 127 tooth gear "T" must be remounted (without bracket) to obtain metric thread pitches through gearbox.  
(b) When disassembling setup, remount 22 tooth gears "U" and "W", Figure 5.

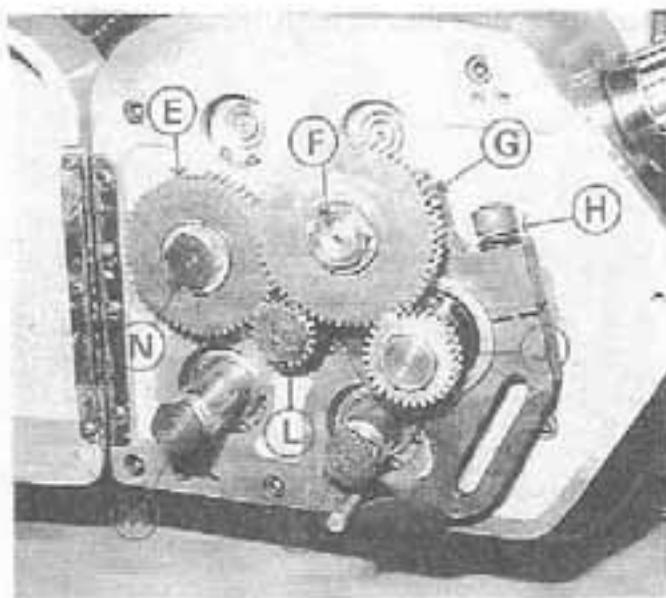

Figure 7 - Mounting Change Gear Bracket

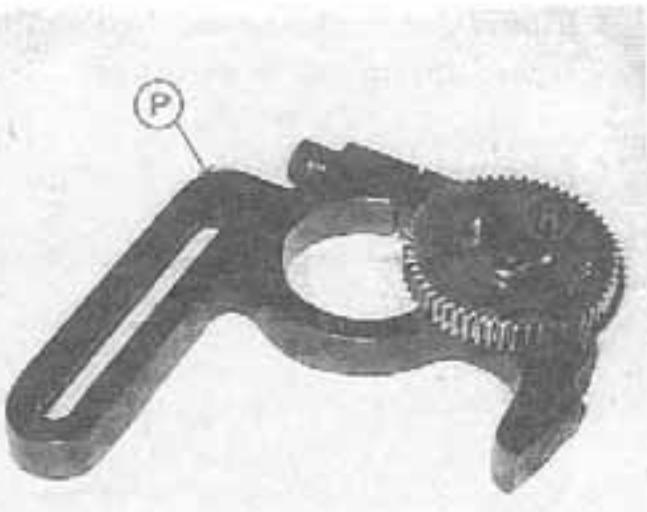

Figure 8 - Change Gear Bracket

#### Metric Threads Using Outside Change Gears

1. Turn disconnect switch "OFF".
2. On metric side of change gear bracket "P" Figure 8 mount "Idler Gear" "R". Do not tighten bolt "S" fully.
3. Loosen knob "B", Figure 1, open gearbox door and remove 127 tooth gear "T", Figure 4.
4. Mount change gear bracket assembly, Figure 8, on pivot post "V", Figure 9. Do not tighten bracket bolt "U" fully.
5. Remove "First Gear" "U", Figure 5, and replace bolt. Do not misplace key.
6. Mount "First Gear on Screw" "T", Figure 9.
7. If thread chart specifies number of teeth in "Tumbler Gear" to be other than 22 teeth, remove gear "Y" and replace with specified gear.
8. Adjust "Idler Gear" "X" with 0.003-0.004 backlash between it and "First Gear on Screw" "T". Use plastic shim stock to help determine backlash. Tighten bolt "W".
9. Pivot bracket to obtain 0.003-0.004 backlash between "Idler gear" "X" and "Tumbler Gear" "Y". Tighten bracket bolt "J".

10. Make certain key is in place and remount 127 tooth gear "A". Figure 10. Tighten bolt "Z".
11. Make certain all gears are properly meshed and all bolts tightened.
12. Close gearbox door, tighten knob "B" Figure 1, and turn three-change knob "C" to position specified on chart.
13. Turn English/Metric knob "D" to "Metric".
14. Turn Feed/Thread knob "E" to "Thread".
15. Follow same procedures for setting carriage stop, lead screw nut and compound slide as when cutting threads from the gearbox. Use of carriage control lever "G", Figure 1, and quick-acting handle "P", Figure 3, will also be the same as when cutting threads from the gearbox.
16. Observe same operational cautions as when cutting threads from gearbox.

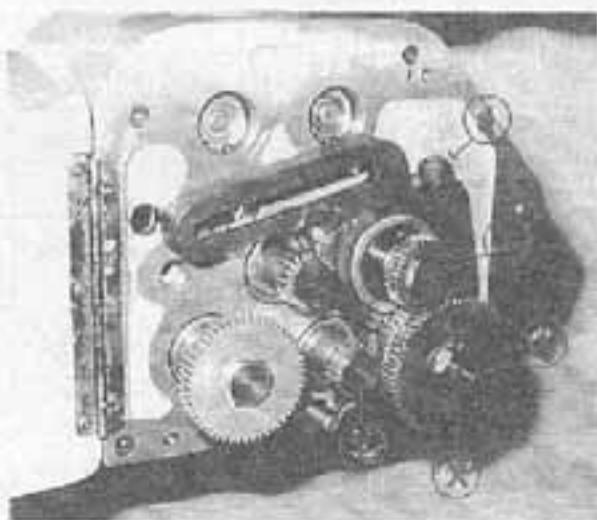

Figure 9 - Mounting Change Gear Bracket

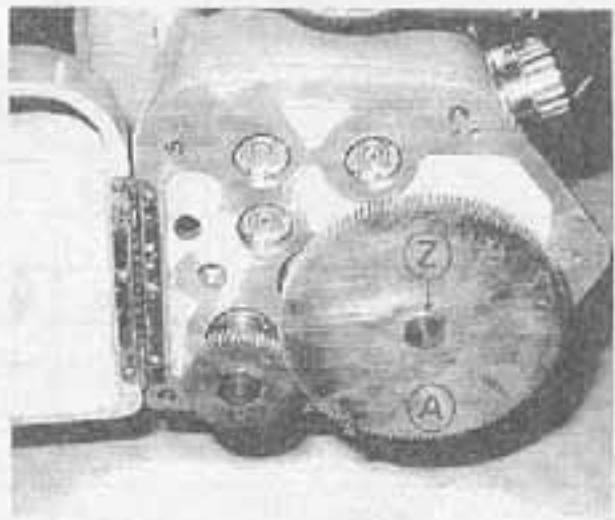

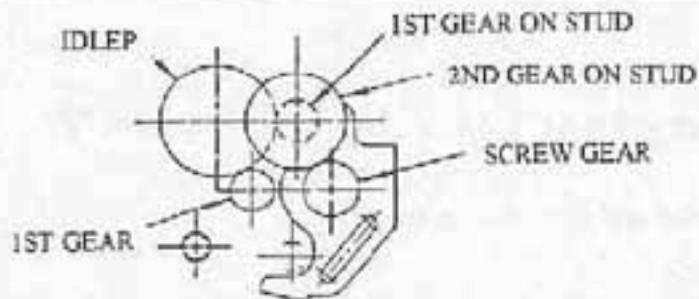

Figure 10 - Mounting 127 Tooth Gear

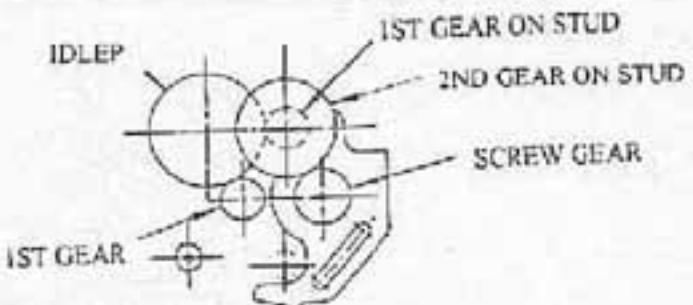

- NOTE :**
- (a) 50 tooth gear "S", Figure 4, and 127 tooth gear "T" must be remounted without bracket to obtain metric thread pitches through gearbox.
  - (b) When disassembling setup, remount 22 tooth "Tumbler Gear" "W", Figure 5, and 22 tooth "First Gear" "U".

## ENGLISH THREADS

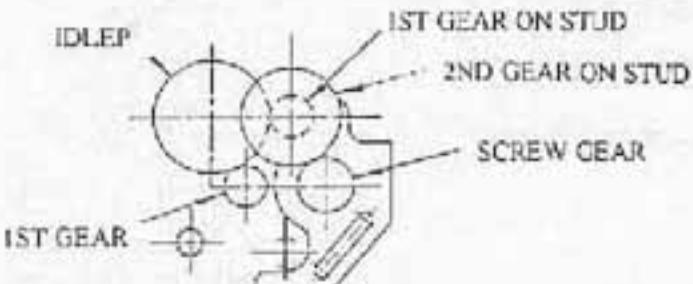

THREADS PER INCH	KNOB	FIRST GEAR	1ST GEAR ON STUD	2ND GEAR ON STUD	SCREW GEAR	IDLER	THREADS PER INCH	KNOB	FIRST GEAR	1ST GEAR ON STUD	2ND GEAR ON STUD	SCREW GEAR	IDLER
